Health programming for men who have sex with men (MSM) in South Africa has been ignored or absent until fairly recently, despite this population being at high risk for HIV acquisition and transmission. Anova Health Institute, with support from the US President’s Emergency Plan for AIDS Relief (PEPFAR)/United States Agency for International Development (USAID) and in collaboration with the South African National Department of Health, launched the first state sector MSM-targeted sexual health clinic in 2010. The clinic has been successful in attracting and retaining MSM in care, and lessons learned are described in this article. Components contributing to the creation of MSM-appropriate healthcare services are discussed.

For multi-factorial reasons, MSM are at particular risk for HIV acquisition and transmission.[4] Biologically, unprotected receptive anal sexual intercourse is about 16 times more likely to transmit HIV than unprotected vaginal sexual intercourse.[7] This is due to the friable nature of the rectal mucosa, which does not contain mucous-producing cells like the thicker, self-lubricating lining of the vagina.

The vulnerability of MSM is further increased by structural factors such as a lack of funding for MSM-appropriate services, lack of specific skills training of health providers, and institutionalised stigma within the public healthcare sector. MSM patients generally avoid being identified as MSM, culminating in their elevated risk of HIV acquisition, transmission being overlooked, and a lack of counselling about the risks associated with unprotected anal sex.[5]

Organisations such as the Anova Health Institute, through its innovative Health4Men project, and the Desmond Tutu HIV Foundation have been active in addressing these concerns in SA. In 2009 the Anova Health Institute, with support from the US President’s Emergency Plan for AIDS Relief (PEPFAR)/United States Agency for International Development (USAID), launched the first state sector clinic dedicated to MSM in the country. A further 6 sites have subsequently become operational across multiple provinces. Invaluable lessons have been learned through this process, which will undoubtedly serve as a template for the ongoing expansion of such services.[6,7]

MSM experience mainstream state sector healthcare services as unfriendly and prejudiced, which creates a barrier to accessing such services.[8] Many local healthcare centres have become friendly to women at the exclusion of men. Women are a captive audience in these clinics, which
they attend for antenatal care, childhood vaccinations, completion of children's road-to-health growth charts and other services. Clinics respond by improving their female-specific skills and services. It is not unusual to find most of the educational materials in HIV clinics focusing on issues such as breastfeeding and female contraception, thereby alienating HIV-positive men. Other barriers to MSM healthcare access include fears about confidentiality related to their HIV status and sexual behaviour. The local catchment area of primary healthcare services is also often problematic; MSM who experience community-based stigma are unlikely to attend a clinic where they are known to other patients or staff members.

For a health provision site to be considered MSM-appropriate, a number of criteria need to be met. Firstly, most MSM require more than a friendly service (often incorrectly referred to as an MSM-sensitised service); they expect competence regarding their specific sexual healthcare needs. Services therefore need to be both sensitive and competent if they are to attract and retain MSM in care.30

The Ivan Toms Centre for Men’s Health (ITCMH), a clinic of the Anova Health Institute in partnership with the Western Cape Department of Health (DoH) and funded by PEPFAR through USAID, was inaugurated in February 2010 in Cape Town. It has since provided care to over 3 800 MSM. There are a few features which have contributed to the success of this clinic. There is buy-in and commitment by the provincial and National DoH.31,32 The service is marketed as a sexual health clinic for men. It is neither an HIV nor an antiretroviral therapy (ART) clinic, which means that patients in the waiting room cannot be identified as HIV-positive. Approximately half of the clients in the cohort are HIV-positive and half of those are receiving ART. Other MSM attend for HIV and sexually transmitted infection (STI) screening, syndromic STI management, counselling and other mental healthcare services, harm-reduction services for MSM who use drugs, or for research and information purposes. This model assists in providing an enabling space that promotes feelings of anonymity regarding the reason for attendance, and allays fears of being identified as gay or HIV-infected when attending the clinic.

Clinic staff have received extensive sensitivity and competency training and are accepting of the diversity of MSM. They have become accustomed to providing service to MSM with either a feminine or masculine gender-identity, as well as to transgendered individuals. All staff are accustomed to referring to clients by their preferred name and pronoun (as opposed to their legal name).

MSM = men who have sex with men; HCT = HIV counselling and testing; ART = antiretroviral therapy; PEP = post-exposure prophylaxis; PrEP = pre-exposure prophylaxis; STI = sexually transmitted infection; WHO = World Health Organization; SA = South Africa; TDF = tenofovir; FTC = emtricitabine; EFV = efavirenz; NVP = nevirapine; AZT = zidovudine; ABC = abacavir; ATV = atazanavir; HLA = human leukocyte antigen; DEXA = dual energy X-ray absorptiometry.

**Table 2. Recommended service package for addressing the sexual health of MSM: STIs**

<table>
<thead>
<tr>
<th>Disease</th>
<th>Primary care prevention (STIs)</th>
<th>Primary care treatment (STIs)</th>
<th>Optimal specialised care</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gonorrhoea</td>
<td>• Regular screening for symptoms&lt;br&gt;• Condoms and water-based lubricant&lt;br&gt;• Risk-reduction counselling as for HIV</td>
<td>• Syndromic treatment according to SA guidelines&lt;br&gt;• Partner(s) notification and treatment&lt;br&gt;• Be aware that gonorrhoea can occur in the urethra, pharynx or anus of MSM&lt;br&gt;• Consider drug-resistant gonorrhoea in cases of treatment failure</td>
<td>• Confirm diagnosis with swab- and laboratory-based testing, including NAATs where available&lt;br&gt;• Treat confirmed cases as for primary care&lt;br&gt;• Consider screening for asymptomatic disease at urethral and non-urethral sites</td>
</tr>
<tr>
<td>Chlamydia</td>
<td>• Regular screening for symptoms&lt;br&gt;• Condoms and water-based lubricant&lt;br&gt;• Risk-reduction counselling as for HIV</td>
<td>• Syndromic treatment according to SA guidelines&lt;br&gt;• Partner(s) notification and treatment&lt;br&gt;• Be aware that chlamydial infections occur in the urethra, pharynx or anus of MSM</td>
<td>• Confirm diagnosis with swab- and laboratory-based testing, including NAATs where available.&lt;br&gt;• Consider screening for asymptomatic disease (most cases of anal chlamydial infection will be asymptomatic)</td>
</tr>
<tr>
<td>Syphilis</td>
<td>• Regular assessment of risk&lt;br&gt;• Condoms and water-based lubricant&lt;br&gt;• Risk-reduction counselling about transmission</td>
<td>• Confirm syphilis with laboratory-based RPR and TPHA tests or rapid point-of-care test&lt;br&gt;• Treat at point of care&lt;br&gt;• Partner(s) notification and treatment</td>
<td>• Treat as for primary care&lt;br&gt;• Consider lumbar puncture for HIV-positive MSM with positive blood syphilis serology and any neurological symptoms</td>
</tr>
<tr>
<td>Lympho-granuloma venereum</td>
<td>• Risk assessment&lt;br&gt;• Regular screening for symptoms&lt;br&gt;• Condoms and water-based lubricant</td>
<td>• Treat empirically if STI present and prominent inguinal lymphadenopathy&lt;br&gt;• Partner(s) notification and treatment</td>
<td>• Confirm LGV serovar with NAATs</td>
</tr>
<tr>
<td>Human papilloma virus (warts)</td>
<td>• Transfers easily and not totally prevented by condom use, but condoms still useful and partly effective&lt;br&gt;• Most easily transferred by contact with a visible skin wart, but the virus may transfer even without visible warts&lt;br&gt;• Advise to avoid direct contact with visible warts&lt;br&gt;• Cover visible warts with a plaster or condom&lt;br&gt;• Gardasil vaccination will prevent some types of warts and reduce the risk of HPV-associated cancers (e.g. anal in MSM), but is very expensive</td>
<td>• Treat with topical preparations or cryotherapy&lt;br&gt;• Partner(s) notification and treatment&lt;br&gt;• Refer for surgical opinion if internal or extensive disease&lt;br&gt;• Be aware that penile or anal warts can lead to embarrassment and pain, resulting in sexual dysfunction</td>
<td>• Can use imiquimod ointment preferentially (easier and convenient for patient)&lt;br&gt;• Consider anal pap smear for MSM, especially if prior anal warts&lt;br&gt;• Coagulase laser therapy to anal intra-epithelial neoplastic lesions (similar to cervical intra-epithelial neoplasia in women)&lt;br&gt;• Biopsy any suspicious looking lesions and send for histological evaluation (MSM have a higher risk of anal cancers compared with heterosexual men)&lt;br&gt;• Vaccinate with Gardasil (ideal to vaccinate before onset of sexual debut); might prevent warts and decrease risk of cancers; may also decrease size of existing HPV lesions</td>
</tr>
<tr>
<td>Hepatitis A</td>
<td>• Counselling about transmission (faecal-oral)&lt;br&gt;• Risk assessment&lt;br&gt;• Check hepatitis A IgG antibodies&lt;br&gt;• Previous hepatitis A confers longstanding immunity&lt;br&gt;• Vaccinate if susceptible&lt;br&gt;• Contact trace for immunoglobulin and vaccination of known contacts</td>
<td>• Supportive treatment of acute hepatitis A&lt;br&gt;• Refer to specialist if clinically unwell&lt;br&gt;• Monitor liver function tests and limit physical activity until settled</td>
<td>• Hepatitis A is potentially serious if contracted in adulthood; a small percentage of patients develop severe liver dysfunction and even failure, and consequently require intensive support&lt;br&gt;• Most cases recover with no permanent sequelae as hepatitis A does not have a chronic phase</td>
</tr>
</tbody>
</table>

### Table 2 (continued). Recommended service package for addressing the sexual health of MSM: STIs

<table>
<thead>
<tr>
<th>Disease</th>
<th>Primary care prevention (STIs)</th>
<th>Primary care treatment (STIs)</th>
<th>Optimal specialised care</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hepatitis B</td>
<td>• Counselling about transmission &lt;br&gt;• Risk assessment &lt;br&gt;• Screen all MSM for hepatitis B surface antibodies &lt;br&gt;• Vaccinate if susceptible &lt;br&gt;• Contact trace for immunoglobulin and vaccination of known contacts &lt;br&gt;• Screen MSM for prior hepatitis B infection using hepatitis B surface antigen &lt;br&gt;• Vaccinate all regular hepatitis B-negative sexual partners of MSM known with chronic hepatitis B infections</td>
<td>• Acute hepatitis B requires supportive treatment &lt;br&gt;• Refer if clinically unwell (encephalopathic, extreme nausea, hypoglycaemia, sepsis, etc.) &lt;br&gt;• If hepatitis B and HIV co-infected, initiate TDF-based ART early to prevent disease progression. TDF/3TC should then never be stopped, even if alternative HIV drugs are required in a second-line or salvage regimen &lt;br&gt;• Hepatitis B may be curable with interferon therapy, but this is very expensive with limited access</td>
<td>• Supportive therapy during acute disease &lt;br&gt;• Perform liver function tests, hepatitis B E-antigen and hepatitis B viral load (these parameters assist hepatologists to decide who may benefit most from interferon and related therapy)</td>
</tr>
<tr>
<td>Hepatitis C</td>
<td>• Counselling about transmission &lt;br&gt;• Screen HIV-positive MSM who use crystal methamphetamine &lt;br&gt;• Harm-reduction programmes for drug users (e.g. needle exchange), condoms and water-based lubricant for anal sex &lt;br&gt;• There is no vaccine available; only prevention is to avoid exposure</td>
<td>• Acute hepatitis C requires supportive management &lt;br&gt;• Refer if clinically unwell (encephalopathic, extreme nausea, hypoglycaemia, sepsis, etc) &lt;br&gt;• Antiretroviral medications such as TDF/3TC are inactive against hepatitis C, but co-infected patients should have their HIV treated early at high CD4+ counts</td>
<td>• Perform liver function tests, hepatitis C viral load and genotyping &lt;br&gt;• Refer to hepatologist for assessment for interferon therapy (lower cure rates than for hepatitis B) &lt;br&gt;• Assess and manage mental health in patients taking interferon (causes potentially severe depression)</td>
</tr>
</tbody>
</table>

**STIs = sexually transmitted infections; MSM = men who have sex with men; NAATs = nucleic acid amplification tests; RPR = rapid plasma reagin; TPHA = treponema pallidum haemagglutination assay; LGV = lymphogranuloma venereum; IgG = immunoglobulin G; HPV = human papilloma virus; TDF = tenofovir; 3TC = lamivudine.**

*Source: De Swardt and Rebe.[4]*
The scope of practice encompasses holistic sexual health, including STI and HIV prevention, diagnostic and treatment services, as well as in-house access to mental healthcare services provided by staff who have specific experience in providing such care to MSM. Staff have been intensely trained in the specific features of sexual health pertaining to MSM. Medical staff have an expert understanding of how STI presentations, diagnosis and management plans differ in MSM, compared with heterosexual men. A good example is training in physical examination to detect and diagnose anal and pharyngeal presentations of STIs.

A package of care has been developed for the clinic and a clinical manual is available for guidance both in print format and online (http://www.anovahealth.co.za).[4] It is understood that clinics may not be able to provide an optimal level of MSM healthcare due to resource constraints; therefore, a package of minimal and optimal services has been developed (see Tables 1 - 3).

Some specific features of the ITCMH that have worked well include the provision of MSM-sensitive HIV screening. Counsellors are trained to ask about male and female partners, to identify specific sexual behaviours and their risks (e.g. receptive unprotected anal intercourse), and to avoid adopting a hetero-normative attitude to counselling (such as asking an MSM couple which is the man and which is the women in a relationship). MSM are also encouraged to screen for HIV together with their partners.[14]

Since MSM are at an elevated risk of acquiring and transmitting HIV, prevention technologies assume particular importance. Condoms, although generally available via the state, are mainly marketed through heterosexually-targeted campaigns that do not address the risks of unprotected anal sex. Condom-compatible lubricant required for comfortable anal sex is largely unavailable. Medical male circumcision is likely to fail to protect MSM to the same degree as heterosexual men, which leaves a deficit of effective prevention interventions.[15] Available HIV-prevention resources that are evidence-based – such as condoms, lubricants, post- and pre-exposure prophylaxis (PEP and PrEP), and early treatment for positive MSM – should be prominent at all MSM-targeted sites.

Marketing MSM-appropriate services is challenging, especially in areas where MSM do not disclose their sexual behaviours and remain hidden to the healthcare system. It has taken time for MSM groups to develop trust in the clinic and the most effective marketing has occurred by word of mouth via clients who have had a positive health-affirming experience at the clinic. Health4Men employs peer educators, and key individuals in MSM communities from specific geographical areas have been recruited as ambassadors for the programme. Marketing and information, education and communication (IEC) materials

- International Rectal Microbicides Advocates: http://www.rectalmicrobicides.org
have been developed through testing with MSM focus groups to ensure that the language is locally understood and contextually correct. Health information, referral links and interactive questions and answers are also available from the Health4Men's mHealth programme 'Health4men Connect' (h4m.mobi) and the programme’s website.

The ITCMH was followed by the launch of the Simon Nkoli Centre For Men's Health in Soweto and, more recently, the Khayelitsha Male Clinic (Cape Town), the Zola and Chiawelo clinics (both in Soweto) and the Yeoville clinic (central Johannesburg). These sites have built on the evidence and experience gained from providing services at the ITCMH. Guidelines for the management of common MSM health problems have been developed and packaged into an intensive training package, which can be delivered at healthcare facility level to allow for the provision of non-judgemental, improve staff attitudes and skills and better care. These sites have built on an understanding of diverse male sexual identities and behaviours.
